DETAILED ACTION

This action is responsive to the amendment filed on October 5, 2005. Claims 1-20 and 22-35 are pending.

Response to Amendment

Claim Rejections - 35 USC § 102

1. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

- (e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.
- 2. Claims 1-3, 6-10, 12, 14, 16-19, 23-25, 27, 29, 32, and 34 are rejected under 35 U.S.C. 102(e) as being anticipated by Brown, U.S. Patent No. 6,014,711.

Brown teaches the invention as claimed including services for delivering multimedia messages over a data network (see abstract).

As to claim 1, Brown teaches a method for sending electronic mail from a client operating within a client-server architecture, the method comprising the steps of:

(a) provisioning the client with client non-email broadcast messaging software (col. 5, lines 15-20, Brown discloses a telephone subscriber creating a voice mail message);

- (b) provisioning a server with server non-email broadcast messaging software, wherein the server is in communication with the client (col. 5, lines 15-20, Brown discloses a voice mail system);
- (c) broadcasting from the client a message in a format of the non-email broadcast messaging software, where the message contains the electronic mail (col. 5, lines 20-23, Brown discloses a voice mail system converting the message into email format);
- (d) receiving the message at the server (col. 5, lines 20-25, Brown discloses a SMTP host receiving the message);
- (e) reformatting the message from a format of the non-email broadcast messaging software to a format compatible with an email server (col. 5, lines 20-25); and
- (f) forwarding the reformatted message to the email server (col. 5, lines 20-29, Brown discloses messages sent from the SMTP host component to the SMTP host).

Regarding claim 2, Brown teaches the method of claim 1, wherein the step of broadcasting the message comprises multicasting the message to a group of network components in communication with the client, and wherein the server is in the group of network components in communication with the client (col. 5, lines 15-25).

Regarding claim 3, Brown teaches the method of claim 1, wherein the step of broadcasting the message containing the electronic mail comprises the steps of:

- (i) identifying a triggering event that precipitates a need for the electronic mail (col. 5, lines 15-25, Brown discloses the voice mail being received);
- (ii) determining an email body, an email subject, and an email address for the electronic mail, wherein the email body, the email subject, and the email 5 address correspond to the triggering event (col. 15, lines 20-34, Brown discloses extraction of an unique identifier); and
- (iii) instructing the client non-email broadcast messaging software to broadcast the message containing the electronic mail, wherein the electronic mail contains the email body, the email subject, and the email address (col. 5, lines 15-25).

Regarding claim 6, Brown teaches the method of claim 3, wherein determining the email body, the email subject, and the email address comprises consulting a database cross-referencing triggering events with email bodies, email subjects, and email addresses (col. 5, lines 20-34, Brown discloses a directory server).

Regarding claim 7, Brown teaches the method of claim 3, wherein determining the email body, the email subject, and the email address comprises a user manually entering the email body, the email subject, and the email address into a test program of the client non-email broadcast messaging software (col. 5, lines 20-34).

Regarding claims 8 and 32, Brown teaches the method of claims 3 and 29, further comprising the step of forwarding the electronic mail from the email server

Art Unit: 2157

through a network to the email address (col. 6, lines 24-38, Brown discloses email being sent by means of a SMTP host).

Regarding claim 9, Brown teaches the method of claim 1, wherein the step of broadcasting the message containing the electronic mail comprises the steps of

- (i) determining an email body, an email subject, and an email address using data processing software;
 - (ii) accessing an application program interface of the data processing software;
- (iii) sending the email body, the email subject, and the email address to the application program interface; and
- (iv) accessing the client non-email broadcast messaging software with the application program interface and instructing the client non-email broadcast messaging software to broadcast the message, wherein the message contains the email body, the email subject, and the email address (col. 5, lines 15-34, col. 6, lines 24-38).

Regarding claim 10, Brown, teaches the method of claim 1, further comprising the step of forwarding the electronic mail from the email server through a network to an email address (col. 6, lines 24-38).

Regarding claim 12, Brown teaches the method claim 1, wherein the message includes a subject in accordance with subject-based addressing of the client non-email broadcast messaging software and the server broadcast messaging server, and

wherein the server is configured to recognize the subject and read the message (col. 6, lines 24-38).

Regarding claims 14 and 24, Brown teaches the method and system of claims 1 and 16, wherein the client non-email broadcast messaging software is different from, but compatible with, the server non-email broadcast messaging software (col. 5, line 15-34).

As to claim 16, Brown teaches a system for sending an electronic mail from a client in a client-server architecture, the system comprising:

- (a) a plurality of clients, wherein each client of the plurality of clients contains client non-email broadcast messaging software, data processing software, and a client application program interface, and wherein each client is in communication with the plurality of clients;
- (b) a non-email messaging server in communication with the plurality of clients, wherein the non-email messaging server contains server non-email broadcast messaging software and an email application program interface, wherein the email application program interface is adapted to receive a message containing the electronic mail and reformat the message from a format compatible with the server non-email broadcast messaging software to a format compatible with an email server; and
- (c) an email server in communication with the messaging server (col. 5, lines 15-34, col. 6, lines 24-38).

Page 7

As to claim 17, Brown teaches the system of claim 16, wherein the data processing software monitors for a triggering event requiring email and determines an email body, an email subject, and an email address for the electronic mail, wherein the email body, the email subject, and the email address correspond to the triggering event (col. 5, lines 15-34).

As to claim 18, Brown teaches the system of claim 16, wherein the data processing software is a testing program of the client non-email messaging software through which a user can enter an email body, an email subject, and an email address for the electronic mail (col. 5, lines 15-34).

As to claim 19, Brown teaches the system of claim 16, wherein the client application program interface is adapted to instruct the client non-email broadcast messaging software to send a message 10 containing the electronic mail to the messaging server (col. 3, lines 3-24).

As to claim 23, Brown teaches the system of claim 16, wherein the client nonemail broadcast messaging software enables broadcasts and multicasts from the plurality of clients (col. 5, lines 15-34).

As to claim 25, Brown teaches the system of claim 16, wherein the client nonemail broadcast messaging software is the same as the server non-email broadcast messaging software (col. 5, lines 15-34, col. 6, lines 24-38).

As to claim 27, Brown teaches the system of claim 16, wherein the email server is adapted to receive the electronic mail and forward the electronic mail through a network (col. 5, lines 15-25).

As to claims 29 and 34, Brown teaches a method and system for sending an electronic mail comprising the steps of:

- (a) broadcasting from a client computer a message in a broadcast format, wherein the message contains the electronic email, wherein the client computer is part of a client-server architecture, and wherein the client computer does not have electronic mail software;
- (b) receiving the message at a server computer of the client-server architecture (col. 3, lines 31-65).
 - (c) reformatting the message from a broadcast format to an email format; and
- (d) forwarding the reformatted message to an email server that is compatible with the email format (col. 5, lines 15-34, col. 6, lines 24-38).

Claim Rejections - 35 USC § 103

Application/Control Number: 09/735,891 Page 9

Art Unit: 2157

3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

- (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 4. Claim 4 is rejected under 35 U.S.C. 103(a) as being unpatentable over Brown further in view of Chuah et al., U.S. Patent No. 6,400,722.

Brown teaches the invention substantially as claimed including services for delivering multimedia messages over a data network (see abstract).

As to claim 4, Brown teaches the method of claim 3.

Brown fails to teach the limitation further including the client monitoring data traffic in a digital wireless packet switching network and the triggering event is an overload on network capacity that requires a change in traffic routing.

However, Chuah teaches the optimization of routing mobile end systems to desired communications servers (see abstract). Chuah teaches the use of wireless packet switching (col. 2, lines 43-62).

It would have been obvious to one of ordinary skill in the art at the time of the invention to modify Brown in view of Chuah to use a digital wireless packet switching network and the triggering event as an overload on network capacity that requires a change in traffic routing. One would be motivated to do so because the broadcast could be used to alert users of the change in traffic routing.

5. Claim 5 is rejected under 35 U.S.C. 103(a) as being unpatentable over Brown further in view of Kozdon et al., U.S. Patent No. 6,456,601.

As to claim 5, Brown teaches the method of claim 3.

Brown fails to teach the limitation further including the client monitoring hard disk space on other clients, and the triggering event is a shortage of hard disk space.

However, Kozdon teaches a method and system for providing call progress tones and audible announcements in a distributed, packetized network environment (see abstract). Kozdon teaches the use of need for more storage (col. 2; lines 5-25).

It would have been obvious to one of ordinary skill in the art at the time of the invention to modify Brown in view of Kozdon to use a client monitoring hard disk space on other clients, and the triggering event as a shortage of hard disk space. One would be motivated to do so because the broadcast could be used to alert users of the shortage of hard disk space.

6. Claim 11 is rejected under 35 U.S.C. 103(a) as being unpatentable over Brown further in view of Rogers et al., U.S. Patent No. 6,301,484.

As to claim 11, Brown teaches the method of claims 1 and 10.

Brown fails to teach the limitation further including the email address is an email address of a wireless pager.

However, Rogers teaches a method and apparatus for remote control of software and hardware features in a wireless communication device using Short Message

Art Unit: 2157

Services (see abstract). Rogers teaches the use of email on a wireless device (col. 3, lines 58-67; col. 4, lines 1-18).

It would have been obvious to one of ordinary skill in the art at the time of the invention to modify Brown in view of Rogers to use an email address of a wireless pager. One would be motivated to do so because the important messages could be broadcast to users away from their computers.

7. Claims 13, 20, and 22 are rejected under 35 U.S.C. 103(a) as being unpatentable over Brown further in view of Bookspan et al., U.S. Patent No. 6,636,888.

As to claim 13, Brown teaches the method of claim 1.

Brown fails to teach the limitation further including the use of the making the format compatible with the email server is Messaging Application Program Interface (MAPI).

However, Bookspan teaches the scheduling of presentation broadcasts in an integrated network environment (see abstract). Bookspan shows evidence of the use of MAPI (col. 14, lines 25-36).

It would have been obvious to one of ordinary skill in the art at the time of the invention to modify Brown in view of Bookspan to use MAPI. One would be motivated to do so because it provides a consistent interface that is well known in use for email servers.

As to claims 20 and 22, Brown teaches the method of claim 16.

Art Unit: 2157

Brown fails to teach the limitation further including the client and email application program interface are one of a dynamic link library, a control, and an object module.

However, Bookspan teaches the scheduling of presentation broadcasts in an integrated network environment (see abstract). Bookspan shows evidence of the use of dynamic link library, a control, and an object module (col. 20).

It would have been obvious to one of ordinary skill in the art at the time of the invention to modify Brown in view of Bookspan to use a dynamic link library, a control, and an object module. One would be motivated to do so because they provide appropriate functionality to the API.

8. Claims 15, 26, and 30 are rejected under 35 U.S.C. 103(a) as being unpatentable over Brown further in view of Lewis, U.S. Patent No. 6,513,019.

As to claims 15, 26, and 30, Brown teaches the method and system of claims 1, 16, and 29.

Brown fails to teach the limitation further including the client non-email broadcast messaging software and the server non-email broadcast messaging software are TIB Rendezvous.

However, Lewis teaches a data processing system that provides substantial throughput for consolidation, integration, structuring, storage and distribution of financial data (see abstract). Lewis shows evidence of the use of TIB Rendezvous (col. 9, lines 60-67; col. 10, lines 1-5).

It would have been obvious to one of ordinary skill in the art at the time of the invention to modify Brown in view of Lewis to use TIB Rendezvous. One would be motivated to do so because it is a well-known software used in messaging.

9. Claims 28 and 31 are rejected under 35 U.S.C. 103(a) as being unpatentable over Brown further in view of Ooe, U.S. Patent No. 6,330,238.

As to claims 28 and 31, Brown teaches the method of claims 16 and 29.

Brown fails to teach the limitation further including the server non-email broadcast messaging software and the email application program interface are a single Transaction Control Protocol / Internet Protocol program and the client computer uses Transaction Control Protocol / Internet Protocol software to broadcast the message containing the electronic mail, and wherein the server computer uses Transaction Control Protocol / Internet Protocol software to receive the message.

However, Ooe teaches a multicast transmission method of transmitting data to a plurality of nodes belonging to a specific group in a communication network based upon a protocol such as TCP/IP (see abstract). One shows evidence of the use of TCP/IP for email and broadcast.

It would have been obvious to one of ordinary skill in the art at the time of the invention to modify Brown in view of Ooe to use TCP/IP for email and broadcast. One would be motivated to do so because TCP/IP is a well-known protocol used for messaging.

Art Unit: 2157

10. Claims 33 and 35 are rejected under 35 U.S.C. 103(a) as being unpatentable over Brown in view of Lewis, U.S. Patent No. 6,513,019, further in view of Bookspan et al., U.S. Patent No. 6,636,888

As to claims 33 and 35, Brown teaches the method and system of claims 29 and 34.

Brown fails to teach the limitation further including the non-email broadcast format is a TIB Rendezvous format and the email format is a Messaging Application Program Interface (MAPI) format.

However, Lewis teaches a data processing system that provides substantial throughput for consolidation, integration, structuring, storage and distribution of financial data (see abstract). Lewis shows evidence of the use of TIB Rendezvous (col. 9, lines 60-67; col. 10, lines 1-5).

It would have been obvious to one of ordinary skill in the art at the time of the invention to modify Brown in view of Lewis to use TIB Rendezvous. One would be motivated to do so because it is a well-known software used in messaging

Brown and Lewis fail to teach the limitation further including the email format is a Messaging Application Program Interface (MAPI) format.

However, Bookspan teaches the scheduling of presentation broadcasts in an integrated network environment (see abstract). Bookspan shows evidence of the use of MAPI (col. 14, lines 25-36).

It would have been obvious to one of ordinary skill in the art at the time of the invention to modify Brown in view of Bookspan to use MAPI. One would be motivated

Art Unit: 2157

to do so because it provides a consistent interface that is well known in use for email servers.

Response to Arguments

11. Applicant's arguments filed October 5, 2005 have been fully considered but they are not persuasive.

Regarding the argument to claim 1, the applicant argues that the reference, Brown, does not disclose a non-email broadcast messaging software. The examiner disagrees, as seen in, col. 5, lines 15-35, there is the same functionality as a non-email broadcast messaging software. The voice mail message that is created by the subscriber is transmitted to other hosts and subscribers; the same as a broadcast which is transmitted from a client to other clients and servers.

Conclusion

12. **THIS ACTION IS MADE FINAL.** Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of

Art Unit: 2157

the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

- 13. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.
 - U.S. Pat. No. 6,003,070 to Frantz.
 - U.S. Pat. No. 6,356,356 to Miller et al.
